

MUHAMMAD ABDULLAH

DevOps Engineer | Cloud & Platform Engineering | Infrastructure as Code

Lahore, Pakistan | +92 309 1738272 | abdullahg1921@gmail.com

linkedin.com/in/m-abd052 | abdullahg1921.github.io/cv

PROFESSIONAL SUMMARY

DevOps Engineer with 3+ year of hands-on experience (including internships) managing Zero Trust enterprise browser security entirely as Infrastructure as Code (IaC) with Terraform and GitHub Actions at an insurance and data-technology company. Delivered 700+ lines of peer-reviewed Terraform across 55+ pull requests, promoting changes from develop to production. Strong foundation in AWS, Docker, Kubernetes (K8s), Jenkins, Linux, and CCNA-level networking, with a security-first approach to access, data protection, and change management.

TECHNICAL SKILLS

Infrastructure as Code: Terraform (HCL), Terraform provider management, remote state (AWS S3 backend), peer-reviewed plan/apply workflows, change management

Cloud (AWS): EC2, S3, IAM, VPC, Route 53, ELB/ALB, Auto Scaling, ECS, CloudWatch, AWS Managed Grafana, Lambda

CI/CD & Version Control: GitHub Actions (composite actions), Jenkins, GitLab CI/CD, Git, GitHub (branch protection, environments, PR reviews), Jira

Containers & Orchestration: Docker, Docker-in-Docker, Kubernetes (K8s), container networking, service discovery

Security (DevSecOps): Zero Trust, IAM/RBAC, Data Loss Prevention (DLP), conditional access, device posture, SAML SSO, JumpCloud, CrowdStrike EDR, Island Enterprise Browser, SOC 2 awareness

Monitoring & Observability: Grafana, Prometheus, AWS CloudWatch, audit-log analysis

Linux & Web Servers: Ubuntu, CentOS, Nginx (reverse proxy), systemd, Let's Encrypt (Certbot), system hardening, troubleshooting

Scripting & Networking: Bash, Python, JavaScript; TCP/IP, DNS, VLANs, NAT, DHCP, OSPF, BGP, Wireshark (CCNA level)

PROFESSIONAL EXPERIENCE

Junior DevOps Engineer | nullBrainer

Feb 2026 – Present | Lahore, Pakistan

- **Infrastructure as Code:** Manage Zero Trust access for an enterprise browser (Island) entirely in Terraform, delivering 700+ lines of code across 55+ peer-reviewed pull requests, deployed to develop first and then to production with plan review in PR comments.
- **Access control (IAM/RBAC):** Built application access policies and 30+ identity groups, onboarding apps for Leadership, Engineering, QA, Sales, and contractor teams with least-privilege scoping; restructured identity groups across multiple resources to match organizational changes without breaking existing access.
- **Root-cause analysis:** Diagnosed rule-priority and wildcard-matching conflicts using audit logs, and fixed them by reordering priorities and replacing wildcards with explicit allowlists, restoring correct access without changing any group's permissions.
- **Terraform provider upgrade & fixes:** Upgraded the Island provider from 0.42.0 to 1.6.0, resolving lock-file mismatches and verifying a zero-destroy plan before production; fixed provider bugs affecting ~20 resources using explicit configuration and lifecycle workarounds, and isolated an API HTTP 500 error for vendor escalation.
- **CI/CD & governance:** Extended a shared GitHub Actions composite action (JavaScript, Jira REST API) with an opt-in input while keeping strict defaults for all other repositories; moved production deployment approvers to Terraform-managed, team-based approval after a security review.
- **Troubleshooting:** Resolved user access issues by tracing identity groups, access rules, and web-category blocks in Terraform; debugged GitHub Actions failures (validate/plan/apply, branch protection) and handled Git rebases and merge conflicts.
- **Collaboration:** Translate requests from senior engineers into precise changes, ask clarifying questions before granting access, flag security trade-offs (over-broad access, wildcard side effects, shared-profile impact), and write clear PR descriptions for reviewers and vendor support.
- **Monitoring:** Set up Grafana for company monitoring and onboarded engineering access to it through Zero Trust policies.

Independent Cloud & DevOps Projects

2023 – Present

- Built and managed AWS environments (EC2, VPC, IAM, Route 53) with Terraform, configuring Auto Scaling, load balancers, and CloudWatch metrics to improve availability and visibility.
- Administered Ubuntu servers, including user access management and security hardening.
- **ReverseRDP (Secure Remote Access POC):** Built a Linux relay server with a Windows agent and MongoDB authentication, enabling controlled RDP access without exposing public ports.

Cloud Computing Intern | CodeAlpha (Remote)

Oct 2025 – Dec 2025

- Deployed and optimized a data-redundancy removal system on AWS to improve cloud database performance.
- Implemented SQL-injection prevention and data encryption, and automated data validation and backups using Python and AWS services.

DevOps Engineer Intern | Code Sentinel (Remote)

Aug 2025 – Oct 2025

- Built GitHub Actions CI/CD pipelines to run tests, build Docker images, and deploy to staging.
- Containerized internal services with optimized Dockerfiles and resolved container networking issues.
- Provisioned AWS test environments (EC2, IAM, S3, VPC, Route 53, ELB/Auto Scaling) using Terraform and CLI; wrote Bash/Python scripts for S3 backups, log checks, and health pings; documented SOPs/runbooks.

Network Engineer Intern | Sky Telecom (Pvt) Ltd.

Sep 2024 – Oct 2024 | Mirpur, AJK

- Configured Cisco routers and switches with VLANs, ACLs, OSPF, and BGP, reducing latency by 30%; managed DHCP/NAT and analyzed live traffic with Wireshark.

KEY PROJECTS (nullBrainer)

- **Clipboard DLP controls:** Created regex-based detectors limiting clipboard copies to 512 and 1,024 characters, combined with copy/paste restrictions in a reusable profile applied across 12 access rules; validated with real support-ticket text (409 characters allowed, 543 blocked).
- **Device posture as code:** Translated manually created device checks into Terraform for Linux (JumpCloud agent, disk encryption), macOS (CrowdStrike, JumpCloud, FileVault, SIP), and Windows (CrowdStrike, JumpCloud) without overwriting existing objects; built trusted-device download rules for Engineers.
- **Multi-environment n8n rollout:** Reworked access for a self-hosted automation platform across dev, QA, and production with environment-specific trust levels, tracing hosts through ECS, ALB, and Route 53 Terraform in the infrastructure repository.
- **Web category reclassification prep:** Prevented access disruption from a vendor web re-categorization by adding Jitsi to Engineering sites and creating an Amazon S3 rule that allows downloads but blocks uploads to prevent data exfiltration; tested in QA with audit logs.
- **Kubernetes chat application:** Deployed a multi-service chat application on Kubernetes, resolving pod crashes, service discovery, and DNS resolution issues across containerized environments.
- **Jenkins & Docker CI/CD pipeline:** Automated a CI/CD pipeline with Jenkins and Docker, configuring Docker-in-Docker builds and container networking for consistent local deployments.
- **Python backend on AWS:** Deployed a production-ready Python backend on an Ubuntu EC2 instance using a virtual environment, a systemd service (auto-restart, start-on-boot), and an Nginx reverse proxy, with HTTPS prepared via Let's Encrypt (Certbot).

EDUCATION

BSc Computer Systems Engineering – Mirpur University of Science & Technology (MUST), Mirpur, AJK

2021 – 2025

CERTIFICATIONS & TRAINING

- **AWS Solutions Architect Associate:** training completed through multiple online courses and YouTube resources; preparing for the certification exam.
- **Linux Administration** (Udemy, Imran Afzal)
- **Networking Fundamentals & Labs** (Udemy, David Bombal)

ACHIEVEMENTS

- Led final-year project "IoT-Based Air Pollution Detection System" (cloud-integrated, real-time monitoring).
- Served as Class Representative, coordinating between faculty and students; recognized by mentors at Sky Telecom for problem-solving and teamwork during live ISP operations.
